Syncing the Satellite
(If required)

▶ 1. What's inside the box?

You should see the following when you open the Orbi RBK40 kit:

- The Orbi Router (RBR40) is the primary equipment that connects to your modem.
- Orbi Satellite (RBS40) is the additional equipment that sends WiFi signals further into your house.
- An ethernet cable, which is generally a short yellow one.
- Two power adapters, one for each unit.

➤ How to connect the router

This is the most critical phase.

- If your modem is already on, turn it off. Take it out of the wall for 30 seconds, then put it back in.
- Connect one end of the ethernet wire to the modem. The other end fits into the yellow Internet port on the back of your Orbi router.
- Plug in and power up the Orbi router.
- Wait for the Orbi router's power LED to become solid white, then pulsing white, and finally solid blue. Blue signals the connection is good.

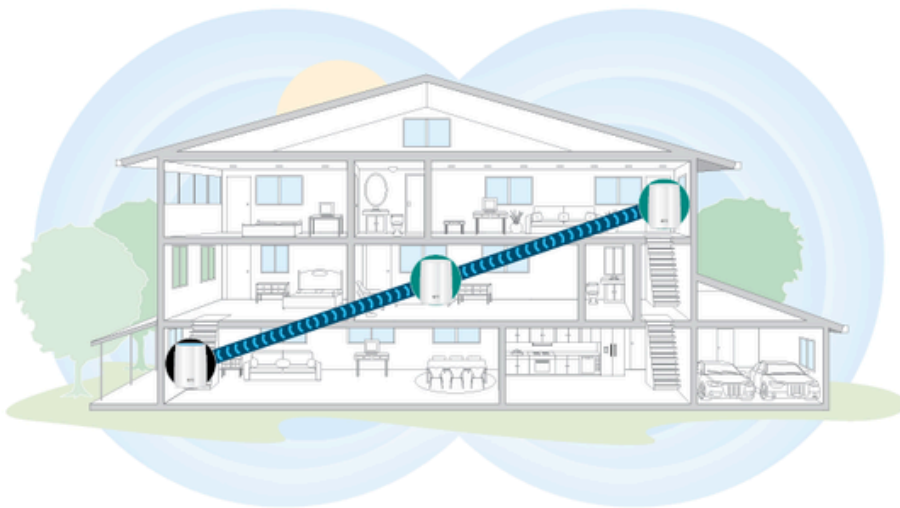

Your primary Orbi router is now working.

▶ Getting the satellite ready

The satellite is what makes the coverage bigger.

- Put the satellite midway between your router and the location where the WiFi is poor. A hallway or open area in the middle is typically optimal.

Connect it to electricity and wait. The ring of LEDs on top will light up:

- Blue indicates a good connection
- Amber means acceptable yet weak.
- Magenta = no connectivity (get it closer to the router)

- The connection is locked in when the light goes out after a minute or so.
- Making Your WiFi Network

You need to set up your WiFi network now that the hardware is working. There are two ways:

Option A: Use the Orbi App

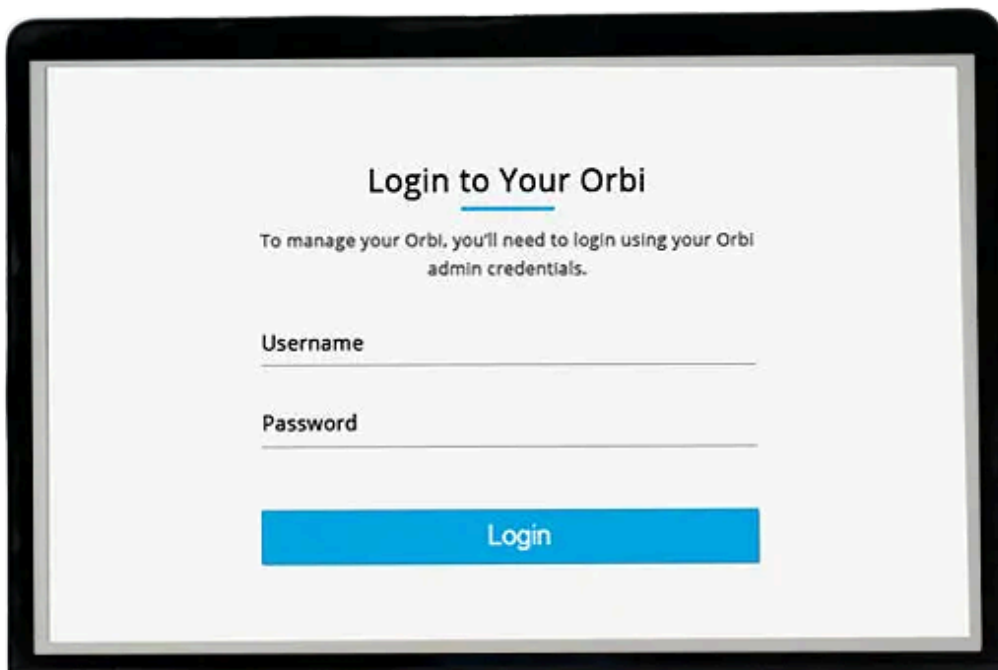

- Download the Orbi app from App Store or Google Play Store (depending on the phone's model you have).
- Use the app by logging in using your Netgear account or creating a new one.
- The app detects your Orbi router and provides step-by-step instructions.

You will choose a name for your WiFi network (SSID).
You will set a password for your WiFi.

- You will also need to make a password for login into the Orbi system that is separate from your WiFi password.
- The program will do a simple test to check sure your internet connection is working.

➤ Option B – Using a Web Browser

- Follow the directions on the device's bottom label to connect your computer or phone to the Orbi's default WiFi.
- Visit the site by typing "orbilogin.com" or "192.168.1.1" in a browser.
- Log in using the default information on the sticker.

- Follow the setup wizard instructions on the screen:

Set a name and password for your WiFi.
Make a password for the admin.
Check the connection to the internet.

➤ Syncing the Satellite (If required)

During setup, the satellite usually connects on its own. But if it doesn't:

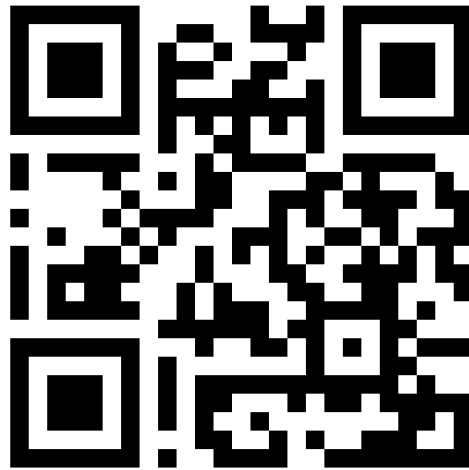

- On the back of the router, press the Sync button.
- Press the Sync button on the rear of the satellite within two minutes.
- Once they are paired, the LED ring should become blue.
